9-year-old students visit the Ercros factory in Sabiñánigo

The Sabiñánigo factory has received a visit from a group of 46 9-year-old students who are in 4th grade at the CEIP Montecorona in the town, accompanied by four teachers. The visit was part of the teaching unit they currently teach, which covers topics such as economic activity, industry, professions, and production processes.

The center's staff gave them a brief presentation of the factory's history, processes, and products, adapted to the topics they were interested in and the age of the group, and the children showed great interest and participation.

It so happens that the factory, which is actively part of the Sabiñánigo environment, is also part of their lives, and many of them are children, nephews, or acquaintances of some worker at the center.

Later, they visited the hydrogen peroxide plant, where the technicians explained how it is produced, they were able to see the control panel, and they conducted some experiments with liquid air, which surprised them the most.

It was a very rewarding day for everyone, and teachers and staff from Ercros agreed to continue it in the future, as it is a facility so closely connected to the community and considering its *on-site* knowledge by the students to be of interest.
